A Visual Guide to Split-Apply-Combine in R

Legend

The symbols used in this document are as follows:

Reshaping

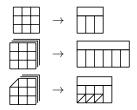

as.matrix Coerces a data-frame to a matrix.

as.table Coerces an array to a contingency table.

as.data.frame Coerces an array or contingency table to a data-frame.

 ${f c}$ Coerces an array or contingency table to a vector.

unlist Coerces a data-frame to a vector.

stack Concatenates the columns of a data-frame into a single column along with a factor. Non-vector columns are dropped.

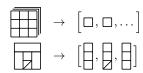

unstack Reverses the effects of stack.

Splitting

as.list Coerces a data-frame to a list of vectors.

split Divides a vector or data-frame into the groups defined by a factor.

$$\begin{array}{c|c} & + & \rightarrow & \left[\begin{array}{c} \\ \\ \end{array}, \begin{array}{c} \\ \end{array}, \dots \right] \\ \hline \\ & + \begin{array}{c} \\ \end{array} \end{array} \rightarrow \begin{array}{c} \left[\begin{array}{c} \\ \\ \end{array}, \begin{array}{c} \\ \end{array}, \begin{array}{c} \\ \end{array}, \dots \right] \end{array}$$

unstack Splits a vector or the column of a data-frame into the groups defined by a factor.

Applying

Some of the following functions may return an array instead of a list depending on the output of f.

tapply Applies a function to each cell of a ragged array.

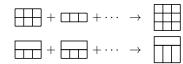

apply Applies a function to margins of an array.

$$\begin{array}{cccc} & & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & & \\ & & \\ & & & \\ & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ & & \\ &$$

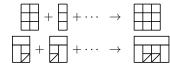

lapply Applies a function over a list or vector.

Combining

rbind Combines a sequence of vectors, arrays or data-frames by rows.

cbind Combines a sequence of vectors, arrays or data-frames by columns.

simplify2array Combines a list of arrays into a single array by adding more dimensions.

unlist Coerces a list of arrays to a vector.

as.data.frame Coerces a list of vectors to a data-frame.

stack Coerces a sequence of vectors into a single-column data-frame along with a factor.

$$\left[\begin{array}{ccc} \\ \\ \end{array} \right], \left[\begin{array}{ccc} \\ \\ \end{array} \right], \dots \left[\begin{array}{ccc} \\ \\ \end{array} \right]$$

unsplit Combines a sequence of vectors or data-frames into a single vector or data-frame by interleaving rows according to a factor.

$$\begin{bmatrix} \begin{bmatrix} 1 \\ 1 \end{bmatrix}, \begin{bmatrix} 1 \\ 1 \end{bmatrix}, \dots \end{bmatrix} + \begin{bmatrix} 1 \\ 1 \end{bmatrix} \rightarrow \begin{bmatrix} 1 \\ 1 \end{bmatrix}$$

merge Merges two data-frames by common columns.
